

In The Specification:

In the section “Detailed Description of the Preferred Embodiments”, please replace Col. 2, lines 40-46, as follows:

According to the present invention, a temperature sensor 42 having a threaded portion, 40, communicates with the insulation deck 30 in the cylinder head 24 adjacent the combustion chamber 28. Preferably, the temperature sensor 42 is a thermistor as is known in the art. The temperature 42 senses the cylinder head 24 temperature and relays the information to an electronic engine controller (EEC) 44 having a keep alive memory (KAM) storage device 46.
